ABQ ECA Workshop Demo Runbook

Event: ABQ BioPark Endangered Conservation Aquatic species (ECA) workshop **Dates:** 2026-06-01 → 2026-06-05 **Audience:** SHOAL partnership conversation; AZA / EAZA coordinators; CARES network leads **Demo driver:** Aleksei Saunders

Demo sequence, talking points, recovery paths. Read once at home, run through twice, keep open on your phone during the talk.

---

0 · One-day-before checklist

Run this the morning of demo day, in this order, before you open the laptop in front of anyone:

- [ ] **Data freshness.** SSH to staging: `ssh deploy@46.224.196.197 'cd /home/deploy/madagascarfish/deploy/staging && docker compose exec -T web python manage.py seed_demo_coordination'` (no `--clear` — this is a no-op on already-seeded demo rows). If you've added real CARES populations since the last run, the demo programs/recommendations/events still pin against your real data.
- [ ] **Public site.** Hit `https://malagasyfishes.org/` from a clean incognito window — the hero stat must show a non-zero number.
- [ ] **Coordinator dashboard.** Hit `/dashboard/coordinator` (logged out). All seven panels render. Panel 6 shows ≥ 3 open recommendations, mix of priorities. Panel 7 shows ≥ 3 events.
- [ ] **A flagship profile.** `/species/<menarambo-id>/` — silhouette renders, IUCN badge says CR, CARES + SHOAL chips both show.
- [ ] **Map.** `/map/` — Leaflet loads, generalized clusters appear, "Filtered to *X* · Clear" chip works.
- [ ] **Husbandry.** `/species/<menarambo-id>/husbandry/` — disclaimer visible, water ranges populated, CARES sourcing block at bottom.
- [ ] **Browser pre-warmed.** Hit each of the URLs above once so the Vercel ISR cache is warm. A cold demo on the first click is the worst time to hit the 1.5s SSR roundtrip.

Anything fails: jump to §6 (recovery).

---

1 · The story arc

The demo is **15 minutes worst-case, 8 minutes ideal**. The throughline:

> *"Madagascar's freshwater fish are the most-imperiled vertebrate group on the island, and the ex-situ work is split across institutions and hobbyist keepers who don't share a registry. Here's a platform that integrates IUCN, CARES, SHOAL, and zoo studbook data in one place — public for awareness, restricted for coordination."*

Three beats:

1. **Public surface (3 min)** — what a Tier 1 visitor sees.
2. **Coordinator surface (5 min)** — what a Tier 3+ partner sees, panel by panel.
3. **What's underneath (2 min)** — data sources, integrations, the "why we built this" framing.

Skip the third beat if you're tight on time. The coordinator dashboard is the conversation centerpiece.

---

2 · Beat 1 — Public surface

Open `https://malagasyfishes.org/` (from a clean tab, ideally incognito so the SHOAL audience sees the no-login experience).

Talking points (in this order):

1. *"Public surface. No login."*
2. Point at the **coverage-gap stat in the hero** — read the number out loud. *"X CR/EN/VU species, no captive population on record anywhere. That's why the platform exists."*
3. Click the stat → **species directory pre-filtered to those species**. *"Same data, drillable from the homepage. Default filter hides introduced species — toggle to include."*
4. Click into a flagship profile (suggest *Paretroplus menarambo*).
5. On the profile, point at:
    - The **IUCN badge** (CR) and the conservation summary panel.
    - The **CARES priority chip** and the **SHOAL priority chip** in the header. *"Both partner-network signals in the header. Not behind a click."*
    - The **distribution map thumbnail** — *"coordinates generalized for threatened species per GBIF guidance."*
    - The **husbandry teaser** with difficulty factors.
    - The **External References** card linking IUCN Red List + FishBase — *"we link to authoritative data, we don't duplicate it."*

Don't open the husbandry page in this beat unless asked. It's deep; save it for follow-up Q&A.

---

3 · Beat 2 — Coordinator surface

Open `/dashboard/coordinator` in a new tab.

This is the conversation centerpiece. Walk the panels in order, but be ready to skip ahead if a partner zooms in on one — that engagement is the goal.

Panel 1 — Coverage gap

"Endemic, threatened, zero captive populations. Sorted by IUCN severity. Endemic-only by default — toggle off if a partner asks about non-endemic threatened fish."

Panel 2 — Studbook / coordinated breeding status

"Three buckets: studbook-managed, breeding-but-not-studbook, holdings-only. The middle bucket is the one nobody talks about — fish bred at hobbyist scale, outside any formal program. Made visible."

Panel 3 — Sex-ratio / demographic risk

"Per-population: M.F.U breakdown plus risk reasons — skew, unsexed-fraction, undersized cohort. Coordinators triage from here."

Panel 4 — Stale census

"Populations whose most recent census is over 12 months old. The 'who needs an update call' list."

Panel 5 — Transfer activity

"Live transfer ledger. In-flight on top — proposed, approved, in-transit. Completed in the last 90 days below. Permits, CITES references, source and destination tracked per row."

Panel 6 — Open breeding recommendations

"Coordinator to-do list. Critical and High at the top, overdue tagged red. Modeled against the EAZA Population Management Manual §3.14 breed/non-breed/transfer cut and the AZA SSP Handbook Chapter 4 Breeding and Transfer Plan structure."

Panel 7 — Recent reproductive activity

"Per-population event ledger. Last 90 days — spawning, hatching, mortality, acquisition, disposition. Roll-up at the top, detail table below."

Backup answer if someone asks about access tiers: *"This page is served via a server-side service token to a Tier 3+ audience. Production-gated by `COORDINATOR_API_TOKEN` so an unauthenticated browser can't reach the underlying API directly."*

---

4 · Beat 3 — What's underneath (skip if short on time)

Open `/about/data/` (or have it queued in another tab).

Talking points:

1. *"IUCN is source of truth. We mirror their assessments, never independently edit conservation status. There's a governance path for manual expert review when an assessment is contested."*
2. *"Darwin Core for occurrence records, GBIF-publishable. Coordinate generalization for threatened species follows GBIF's sensitive-species guidance."*
3. *"FishBase, CARES, SHOAL Madagascar priority list — integrated read-only, not duplicated."*
4. *"Open source, Apache 2.0. I'm hosting it today. Long-term governance is a SHOAL conversation — that's part of why I'm here."*

---

5 · Q&A talking points (have these queued mentally)

If they ask...	Lead with...
"Can hobbyists submit data?"	Today: `/contribute/husbandry/` is a Django-backed contact form. Lands in admin, manually reviewed before anything goes public. Post-MVP: Tier 3+ moderated submission queue.
"How do you handle disagreement between IUCN and an expert?"	`ConservationStatusConflict` model, four-outcome resolution flow — accept IUCN, retain manual, reconcile, dismiss. Audit log on every state transition. Public badge always reflects the most-recent-accepted assessment.
"What about hybrids / undescribed morphospecies?"	Provisional name field plus `taxonomic_status` enum. Directory shows a "Provisional Name" pill. The profile is honest about description status.
"Who owns this?"	Me, today. Open source. Long-term governance TBD — designed to be hostable independently, there's an OPERATIONS.md runbook.

"GBIF / Darwin Core export?"	Schema is GBIF-shaped. The export pipeline — Darwin Core Archive plus IPT — is post-MVP, gate 08+. The coordinate-sensitivity work landing first is a precondition for safe publication.
"ZIMS integration?"	Read-only, via institutional data-sharing. We map ZIMS member IDs to our `Institution` rows. No write-back.
"Why not a Google Form / Airtable?"	Five-tier access, GIS-aware coordinate generalization, GBIF/Darwin Core compatibility. Hard to retrofit onto a generic tool. The tradeoff is real engineering — which is why the SHOAL conversation matters.

---

6 · Recovery from in-demo failures

Coordinator dashboard panels render empty

Most likely: `COORDINATOR_API_TOKEN` not set on Vercel, or token rotated out of sync with staging backend.

Recovery in front of audience:

1. Don't apologize. Say *"the dashboard's running on a service token that I can show you another way."*
2. Open `https://api.malagasyfishes.org/api/v1/coordinator-dashboard/coverage-gap/` directly in a new tab — the API responds with the same payload that would feed Panel 1.
3. *"That's the same data; the dashboard just renders it. We can fix the token afterwards."*

Recovery after demo: OPERATIONS.md §11.2.

Map page doesn't load

Most likely: Leaflet tiles blocked on the conference Wi-Fi, or the `/api/v1/map/localities/` endpoint slow-cold.

Recovery:

1. Switch to map list view: `/map/?view=list`. Same data, no Leaflet network dependency. *"This is the accessible / keyboard-friendly view. Same locality records, no JavaScript map."*

A specific profile 404s

Most likely: ID drift since you took the screenshot list.

Recovery:

1. Hit `/species/` and pick the first CR row. *"Let's look at this one instead."* — coordinator audiences won't notice or care which flagship you pick.

Conference Wi-Fi dies entirely

Have the hero screenshot, the dashboard screenshot, and one full profile screenshot saved to your phone's photo roll **before you fly**. Walk through them on the phone if needed. Less polished but the talk track stays intact.

---

7 · After-demo capture

Within 24h of each demo session, write down (in `docs/planning/ux-review/` or as a fresh issue):

- Which panel each questioner zoomed in on. The signal is what they cared about, not what you said.
- Any feature requests, no matter how off-topic. They become the post-workshop backlog.
- Any data they offered to share. Get the email then; introductions go cold within a week.

---

8 · One-line failure-mode summary for your phone

If everything else fails:

1. Show `https://malagasyfishes.org/` and the coverage-gap stat.
2. Talk through the species → IUCN → CARES → SHOAL integration verbally.
3. Describe the coordinator panels by name without showing them.
4. Promise a follow-up email with screenshots.

That's a 60-second talk track that survives any infrastructure failure short of "the laptop won't turn on."
